

ABSTRACT

A coffee maker includes a base (1), a lower portion (2) of a body, an upper portion (3) of the body, a heater (4), and a water pipe (5). The base (1) is placed at the bottom of the coffee maker and connected to the lower portion (2) of the body through screws. The base (1) has a supporter (11) by which a coffee cup can be supported. The upper portion (3) of the body comprising a water tank (31), a lid (32), an infusing house (33) and a flow distributor (34), is placed on the top of the body. One end of the water pipe (5) is connected to the water tank (31) and another end is connected to the infusing house (33). The water pipe (5) is contact to the heater (4). The coffee maker also includes an actuating mechanism (6), which allows the upper portion (3) of the body to move up or down. Upon the height of the coffee cup placed at the supporter (11), by turning a knob (63) of the actuating mechanism (6), the upper portion (3) of the body may be adjusted to prevent coffee from spaying out from the coffee cup.
